Forensic Voice Comparison Report

Introduction

Case ID:

Date: 2000-01-01 00:00:00

Suspect Name :

Analyst:

Methodology

1. Data Collection:

Two voice samples were provided for analysis:
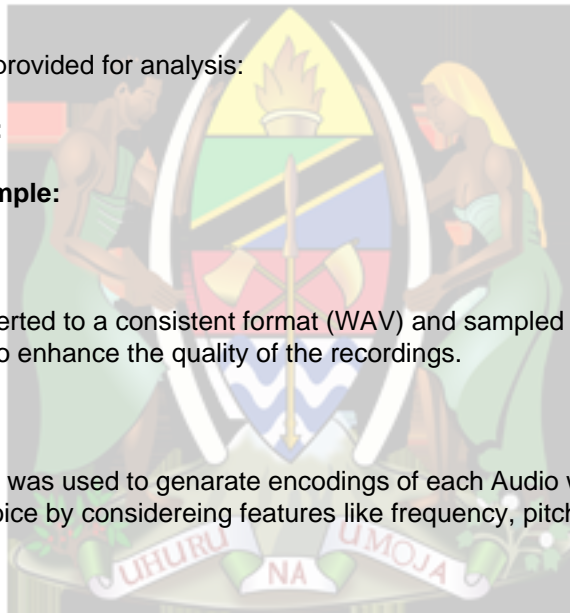

- **Suspect Voice Sample:**

- **Crime Scene Voice Sample:**

2. Pre-processing:

The audio files were converted to a consistent format (WAV) and sampled at 16 kHz. Noise reduction techniques were applied to enhance the quality of the recordings.

4. Comparison:

A Machine learning model was used to genarate encodings of each Audio where this encodings contain the uniqueness of each voice by considereing features like frequency, pitch , Mel Spectogram , Amplitude etc

Analysis

Suspect Voice Sample:

- **Duration:** 10 seconds

- **Sampling Rate:** 44100 Hz

Crime Scene Voice Sample:

- **Duration:** 10 seconds

- **Sampling Rate:** 48000 Hz

Results:

- Overall Likelihood Ratio (LR): 0.699999988079071

Based on the likelihood ratio 0.699999988079071 Evidence suggests the speakers are likely different.

Conclusion

Based on the likelihood ratio 0.699999988079071 Evidence suggests the speakers are likely different.

Recommendations:

- Further forensic examination and corroboration with additional evidence are advised to strengthen the findings.

- Consideration of context and other case-specific factors should be taken into account when interpreting the results.
